

This is the Alpha 1 distribution of gDock, a minimal dock for Windows that can sit with the taskbar, or without it. This dock comes pre-configured out of the box, it has links to common apps (IE, etc...), and is very simple to use.

left-clicking starts the app, or changes to the folder-tab specified. right-clicking deletes the icon, or when in the Tasks tab folder, terminates the application. middle (mouse wheel) clicking opens up the properties of that icon, allowing you to edit it.

This app makes use of my Icon command system, that is, icons with special names will invoke special commands. Start PNG is a good example, and PNG files named as such will invoke and show that start menu. There is a list in the Pin a File dialog box that lists the (currently) known commands.

This comes with the [FWW Icon set](#) (pngs), that is released by LGPL, as is included Credits to the original authors and such.

This is the successor to [TaskDock](#), a real, true dock app.

You can download it using following link:
