

All Hail the Microsoft Programming Gods. Windows 7 God mode is a function you can unlock (that was not advertised) which will allow you to customize all your system settings from one place. This looks like it was something developers forgot to remove and it leaked out. Of course PCModers would be very interested in this ability to modify your Windows 7 system easily. Here are the steps to enable it.

**1:** Right click.

**2:** Click create folder.

**3:** Name new folder "GodMode.{ED7BA470-8E54-465E-825C-99712043E01C}" and press enter.

**4:** The folder icon changes form to look like the control panel.

# How to enable Windows 7 GOD mode

Wednesday, 06 January 2010 11:47

---

Once you open this folder you will have access to a wide array of configurations you can tweak easily, all from one place...NICE..Click on the picture below to see the items you have access to in this new folder.
